Haritaki as an Immunomodulator: Traditional Ayurvedic Insights and Modern Research

Abstract

Introduction

This paper explores the immunomodulatory potential of *Terminalia chebula* (*Haritaki*), a revered herb in Ayurveda known for its multifaceted health benefits. *Rasayana* to its rejuvenating properties in Ayurveda. The research synthesizes findings from various studies to elucidate *Haritaki's* impact on the immune system through its diverse pharmacological actions. It examines *Haritaki's* ability to enhance both cellular and humoral immunity, supported by evidence of increased lymphocyte proliferation, elevated antioxidant enzyme levels, and modulation of cytokine production. Furthermore, the study investigates *Haritaki's* therapeutic efficacy against specific diseases and its potential as an adjunct therapy in conditions like diabetes and amoebiasis. Nowadays different modern researches have revealed its chemical components and pharmacological activities. Main phytochemicals of *haritaki* are chebulic acid, gallic acid, chebulagic acid, terpenoids and anthraquinones.[1] The findings underscore *Haritaki's* significance as an immunostimulant and its potential applications in promoting overall health and combating immune-related disorders.

Methods: All the Ayurveda literature, i.e., *Charak Samhita*, *Sushrut Samhita*, *Bhavaprakasha Nighantu*, and all articles related to *haritaki* is analysed and data collected related to *haritaki* to assess the role of Immunomodulator.

Result: A review of classical Ayurvedic literature and modern research evidence suggests that *Haritaki* holds significant promise effect as immunomodulator, owing to its ability to balance all three doshas, enhance *Ojas* and *Agni* & offer scientifically supported antioxidant activity.

Discussion: *Haritaki* is considered a *Rasayana* Herb for supporting longevity and improving resistance to illness. *Haritaki* is a foundational herb in Ayurveda, earning titles like the “king of medicine” due to its wide-ranging therapeutic benefits.[2]

Keywords: *Rasyana, Immunomodulator, Haritaki, Vyadhiksamta, Terminelia Chebula, Phytochemical, Antioxidant Activity.*

Introduction:

"Health is the soul that animates all the enjoyments of life, which fade and are tasteless without it." (Seneca).[3] That is the prime objective mentioned in Ayurveda "Swasthasya swastha Rakshan". To maintain excellent health Ayurvedic texts mention lots of therapies and drugs. One of the famous is Rasayan therapy. Rasayana is one of the eight divisions of Ayurveda. Rasayana therapy enriches rasa with nutrients to help one attain longevity, memory, intelligence, health, youthfulness, excellence of lustre, complexion, and voice, optimum development of the physique and sense organs, mastery over phonetics, respectability, and brilliance. In Sanskrit, Rasayan means "path of essence." [4] The word Rasayana is derived from two root words, 'Rasa' and 'Ayana.' The first root word, Rasa refers to the first of the seven dhatus. This substance is derived primarily from food and contains all the nutrients required by various tissues. It also could refer to the Ojas - which constitute the essence of all seven dhatus and form the seat of a vital life force. The second root word 'Ayana' refers to circulation in general. Furthermore, 'Ayana' denotes three more purposeful meanings, viz., 1. Kham (space), 2. Srotas (Channels/vessels), and 3. Marg (way). Thus, 'ayana' could be interpreted as a highly dynamic process, which keeps all the vital processes on the move, enriches the body with the best forms of 'dhatus', and prevents degenerative processes.

According to Acharya Charaka, the use of Rasayan results in longevity (*Dirgyhamaayu*), memory (*Smriti*), intellect (*medha*), freedom from diseases (*Aarogya*), youth (*Tarun vaya*), complexion (*Varna*), and voice (*Swar*), the excellent potentiality of the body (*Deha Bala*) and the sense-organs (*Indriya Bala*), *vāk-siddhi* (i.e. what he says comes true), respect and brilliance. [5]

Rasayana drugs are believed to slow down the aging process (*jara*) and provide a defence mechanism against diseases (*vyadhi*). *Rasayana* also improves the host resistance of an individual, helping to prevent aging and diseases. Specific diets and lifestyle changes are also advised in *Rasayana* therapy. *Rasayana* drugs also act on the immune system and the immune system has connections with several other organs and can directly or indirectly influence the actions of many other organs. *Rasayana* shows myriad actions on other organs by acting on the

immune system. Different varieties of *Rasayana* are mentioned in Ayurveda. *MedhyaRasayana*(nootropic), *Naimittika* (promoter of specific vitality in specific diseases), *Ajasrika* (dietary *Rasayana*), and *Achara Rasayana* (conducting *Rasayana*) are very useful in the prevention. [6]

In Ayurveda, *Haritaki's* effects are described through its general properties like being a rejuvenator and disease conqueror, while modern science identifies specific immunomodulatory mechanisms, such as modulating cytokines and immune cells to combat inflammation and infection and *Haritaki* boots overall immunity to increase vitality and longevity and modulates the function of immune cells such as CD4+ and CB8+ T cells and enhances natural killer(NK) cell activity. *Hartikaki* also focuses on restoring balance to the body's through its inherent qualities and their bioactive compounds interact with target like cytokines, signalling pathways and immune cells.

Materials and Method:

This study is narrative review synthesizing classical *Ayurvedic* literature and modern research findings on *haritaki* immunomodulatory effect.

Methodology structure:

Ayurvedic literature review (*Charak Samhita*, *Shushrut Samhita* and *Bahvprakash*)

Modern research insights (PubMed, Google Scholar and Ayush Research Portal)

Immunomodulatory mechanism(Antioxidant, Immunomodulator activity)

Phytochemicals in *Haritaki*

Material has been collected from ancient Ayurvedic text, research journal and electronic database.

Haritaki

Haritaki (*Terminalia chebula* Retz) as a *Rasayana* mention in the *Laghutrayi- Bhavaprakash* (anti-aging). In *charak Samhita chikitsasthan abhaya-amalakiya rasayana paada*, properties of *haritaki* are described as possessing all the six rasas excluding *lavana*, is hot, beneficial,

carminative, light, appetizer, digestive, life-promoting, tonic, excellent sustainer of youthful age, alleviates all diseases and provide strength to the all the sense organs.[7]In Tibetan medicine, *Haritaki* is known as *A-ru-ra* and praised with the adjective *Sman-mchog-rgyal-pa*, meaning the "King of medicines.[8]

Immunity:

The immune system's primary defense mechanism is its ability to identify and eliminate non-self entities. Through a complex regulation of humoral and cellular factors, the system functions throughout the body. The immune system's protective function, which begins with the identification of non-self bodies and substances, places it in a crucial position between the host's healthy and diseased states. The immune system is composed of many interdependent cell types that collectively protect the body from bacterial, parasitic, fungal, viral infections and from the growth of tumor cells. Many of these cell types have specialized functions. The cells of the immune system can engulf bacteria, kill parasites or tumors cells, or kill viral infected cells. Often, these cells depend on the T helper subset for activation signals in the form of secretions formally known as cytokines, lymphokines, or morespecifically interleukins. [9]

Immunomodulator:

An immunomodulator is a drug used for its effects on the immune system. It can be defined as a substance, which can influence any component or function of the immune system in a specific or non-specific way. The concept of immunomodulation is mentioned as *Rasayana* in Ayurveda. Ayurveda has two aims: the first is the prevention and promotion of health and the second is a cure for the disease. *Rasayana* is used for both aims.[10]

"Immunomodulation" means altering an immune response, which may increase or decrease the immune responsiveness. Enhancing immune responsiveness is called immunostimulation, and reducing immune responsiveness is called immunosuppression. An immunomodulator may be defined as a substance, biological or synthetic, which can stimulate, suppress, or modulate any of the components of the immune system including both innate and adaptive arms of the immune response. The essence of immunomodulation is that a pharmacological agent acting under various dose and time regimens displays an immunomodulating effect. [11]

The immune system is multi-layered, with defences on several levels. Most elementary is the skin, which serves as the first barrier to infection. Another barrier is physiological, where pH and

temperature provide inappropriate living conditions for foreign organisms. Once pathogens have entered the body, they are dealt with by the innate immune system and by the acquired or adaptive immune system. Both systems comprise numerous cells and molecules that interact in a complex manner to detect and eliminate pathogens. Both detection and elimination depend upon chemical bonding: surfaces of immune system cells are covered with various receptors, some chemically bind to pathogens, and some bind to other immune system cells or molecules to enable the complex system of signalling that mediates the immune response. [12]

Molecular immunomodulation primarily operates by regulating key signaling pathways and transcription factors such as NF- κ B and AP-1, which control cytokine production and immune cell activation. It also involves modulation of pathways like STING and AKT/PKB, affecting processes like inflammation, T cell activation, and immune tolerance. By influencing molecules such as cytokines, immune checkpoints (e.g., PD-1, CTLA-4), and enzymes like IDO, immunomodulators can either enhance immune defense or suppress excessive inflammation. The implications of these mechanisms include the ability to fine-tune immune responses for therapeutic aims—boosting immunity against infections and cancer or dampening it in autoimmune diseases and chronic inflammation. This molecular control ensures immune balance, preventing harmful overactivation while enabling effective defense, forming the basis of modern immunotherapies. Thus, molecular immunomodulation's role in precisely controlling immune pathways holds significant promise for targeted treatments across various diseases. [13]

Classical text view of *Haritaki* :

Ayurvedic classics have attributed *rechana* (laxative), *lekhana* (scraping), *medhya* (intellect promoter), *netrya* (beneficial for vision), *deepan* (appetizer), *pachana* (digestive), *vataanulomaka* (carminative), *hridya* (cardiotonic), *indriyaprasadana* (nurturing the sense organ), *ayushya* (healthy long life), *brihmaniya* (nourishing the body), *vayasthapana* (antiaging), *rasayana* (rejuvenating), *bala- budhi-smriti vardhaka* (promotes physical strength, intellect power and memory enhancer), *shothahara* (Anti-inflammatory), *vedanahara* (analgesic), *vranashodhan-ropana* (wound cleansing and healing). properties to it. [14]

Bhavaprakash has described different methods of using *Haritaki* to attain different actions. When it is chewed, it enhances digestive fire; when used after rubbing on stone, it acts as

malashodhana (cleanses toxins); when used after boiling. it acts as *sangrahi* (absorbent); and when it is used after frying, it becomes *tridoshashamaka* (pacify *tridoshas*). When *Haritaki* is taken with food, it enhances *buddhi*, *bala*, and *indriya*, and pacifies *tridoshas* and dispels out *mala*, *mutra*, and other toxins. When it is taken after food, it readily cures digestive disorders and pacifies diseases of *vatu*, *pitta*, and *kapha*. To pacify *vata* disorders, *Haritaki* should be used with *ghrita* (ghee), in *pitta* disorders with *sharkara* (sugar), in *kapha* disorders with *lavana* (salt), and in all other diseases with *guda*. [15]

Characteristics of Best Quality *Haritaki* as per *Bhavprakash*

नवा स्निग्धा घना वृत्तागुर्वी क्षिप्ता च याऽम्भसि ।

निमज्जेत्सा प्रशस्ता च कथिताऽतिगुणप्रदा

It should be new (fresh), *snigdha* (smooth), *ghana* (bulky) *vrita* (ovoid shape), *guru* (heavy), drown when dipped in water and weigh about two *karsh*, i.e., equal to the weight of two *Bibhitaki* fruit (approx. 20 g). This type of *Haritaki* is considered as best for medicinal usage. [16]

पथ्याया मज्जनि स्वादुः स्नाय्वामम्लो व्यवस्थितः।

वृन्ते तिक्तस्त्वचि कटुरस्थिस्यात्तुवरो रसः॥ [17]

Pharmacological Actions

The fruit has multiple pharmacological and medicinal activities such as astringent, laxative, digestive, carminative, anthelmintic, antiulcer, antispasmodic, antioxidant, antimicrobial, antiviral, antiseptic, anti-inflammatory, anti-cancerous, antiaging, aphrodisiac, diuretic, purgative, radioprotective, antidiabetic, hepatoprotective, cardioprotective, blood purifier, cytoprotective, antiarthritic. hypolipidemic, adaptogenic, immunomodulator, and wound-healing activity. [18]

Immune Enhancement: *Haritaki* has been shown to stimulate both humoral and cellular immunity. Animal studies have demonstrated that aqueous extracts of *Haritaki* increase white blood cell (WBC) counts, promote lymphocyte proliferation, and enhance antibody production, thereby reflecting improved immune defense mechanisms.[19] Its immunomodulatory activity is attributed to the presence of compounds such as tannins, flavonoids, gallic acid, and chebulagic acid, which also confer it strong antioxidant properties.[20]

Antioxidant Activity

Haritaki is a powerful antioxidant. It scavenges free radicals, reducing oxidative stress on immune cells. Antioxidants neutralize reactive oxygen species, reduce inflammation, and help regulate cytokine levels—vital for healthy immune function. This helps maintain the integrity and function of lymphocytes, macrophages, and other key components of the immune system. [21]

Anti-cancerous

Methanol Extracts of *Haritaki* have shown the ability to induce apoptosis (programmed cell death) in various cancer cell lines, including prostate, breast, and colon cancer, and to inhibit tumour growth. This is primarily attributed to its powerful antioxidant and anti-proliferative constituents.[22]

Radioprotective & Cytoprotective

The administration of *Terminalia chebula* (80 mg/kg body weight, i.p.) prior to whole body irradiation of mice (4 Gy) resulted in a reduction of peroxidation of membrane lipids in the mice liver as well as a decrease in radiation-induced damage to DNA, as assayed by single-cell gel electrophoresis (comet assay). *Terminalia chebula* also protected the human lymphocytes from undergoing the gamma radiation-induced damage to DNA exposed in vitro to 2 Gy gamma-radiation. These results suggest the radioprotective ability of *Terminalia chebula*. [23]

Wound healing:

Topical application of an alcoholic extract of *Terminalia chebula* leaves on rat dermal wounds showed that wounds treated with *Terminalia chebula* healed faster, as indicated by improved contraction rates and a shorter epithelialization period. Reduced lipid peroxide levels in the treated wounds, along with ESR measurement of antioxidant activity through DPPH radical quenching, suggested that *T. chebula* has antioxidant properties.[24]

Antimicrobial Action:

The herb exhibits antibacterial, antifungal, and antiviral properties, further protecting the body from various infections and enhancing the immune system's effectiveness.

Chondroprotective Effect (Protection of Cartilage):

Protecting the joint cartilage and bone from the degenerative damage characteristic of the disease. A standardized ethanol extract of *Terminalia chebula*, in a collagen-induced arthritis study, revealed that these benefits were driven by a precise biochemical mechanism: the

extract substantially downregulated the production of key pro-inflammatory cytokines, including TNF- α , IL-6, and IL-1 β . Given its efficacy in both reducing inflammation and alleviating pain, coupled with a favorable safety profile, the study concluded that the extract is an up-and-coming natural candidate for the management of Rheumatoid arthritis. [25]

Antiulcerogenic activity

Animals pretreated with doses of 200 and 500 mg/kg hydroalcoholic extract showed significant reduction in lesion index, total affected area and percentage of lesion in comparison with control group in the aspirin, ethanol and cold restraint stress-induced ulcer models. Similarly extracts increased mucus production in aspirin and ethanol-induced ulcer models. At doses of 200 and 500 mg/kg of *T. chebula* extract showed antisecretory activity in pylorus ligated model, which lead to a reduction in the gastric juice volume, free acidity, total acidity, and significantly increased gastric pH. Hydroalcoholic extract of the fruit *T. chebula* displays potential antiulcerogenic activity. [26]

Phytochemicals

Anthraquinone glycoside, tannin, chebulagic acid, chebulic acid, chebupentol, chebulanin, corilagin, neochebulinic acid, ellagic acid, gallic acid (1.21%), tannic acid, punicalagin, quercetin, arjunolic acid, sennoside A, succinic acid, β -sitosterol, vitamin C, and proteins. The fruit kernel has arachidic, behenic, linoleic, oleic, palmitic, and stearic acid. The flowers contain chebulin and the leaves have terflavins B, C, and D, punicalagin, and punicalatin. [27]

Gallic Acid - Gallic acid impacts immunity by having anti-inflammatory and immunomodulatory effect, suppressing pro-inflammatory cytokines like TNF- α and IL-6 and its antioxidant properties increases the activity of antioxidant enzymes and decreases the lipid peroxidation in ovaries and normalizes the serum level of sex hormones in PCOS rats and it has been investigated on the serum level of pituitary-ovary axis hormones and action on ovary tissue antioxidant enzymes of PCOS. In animal experimentation with female Wistar rats, GA was given for 21 days, orally, and it resulted Levels of LH, Estradiol and testosterone as well the MDA in treatment group with GA were increased significantly compared to the PCOS group ($p < 0.05$), while the serum level of FSH and progesterone and tissue level of SOD and CAT enzymes were increased significantly in GA-treated groups than the PCOS group. [28]

Chebolic Acid- The study with aqueous extract of *Terminalia chebula* fruits which was already proven as antidiabetic effect has investigated the protective mechanism of Chebolic Acid isolated from *Terminalia chebula*, has shown the significant effect against the progression of AGE-induced endothelial cell dysfunction suggesting that this compound may constitute a promising intervention agent against diabetic vascular complications. [29]

Chebulagic Acid - It was confirmed that the 80% ethanol extract had a greater content of chebulagic acid from the fruit of *Terminalia chebula*, it has been compared with rat intestinal α -glucosidase inhibitory activity, and results showed that this drug can control blood glucose and manage type 2 diabetes which is causative factor for PCOS. [30]

Hydrolysable Tannin - The analysis of the therapeutic potential of Hydrolysable Tannin in adult female rats had shown the best therapeutic potential for weight management, reduction of oxidative stress, and improvement in reproductive health of PCOS rats. [31]

Immunomodulator effect of *haritaki*:

1. The results obtained in the current study show that *Terminalia chebula* extract displays a dose-dependent immunostimulatory effect to antigenic stimulation. Injecting mice i.p. with 10⁹ SRBCs suspended in saline sensitizes them for elicitation of DTH and also induces antibody formation, therefore this system has major advantage; that is, it enables two components of immune response to be measured in the same species under ideal conditions and is relatively simple and inexpensive to perform. *Terminalia chebula* extract produced a dose-dependent increase in both the parameters (i.e., antibody production and delayed-type hypersensitivity). Therefore, it is concluded that the aqueous extract of fruit of *Terminalia chebula* has promising immunostimulant properties. [32]
2. The standardized water extract from *Terminalia chebula* fruit shows robust antioxidative activity, attributable to its rich polyphenolic composition—including gallic and protocatechuic acids. Though less potent in chemical assays than purified gallic acid, it exhibits superior performance in cellular ROS suppression, highlighting its promise for combating oxidative stress in biological contexts. Moreover, 4 mg of *T chebula* extract

significantly decreased the incidence, volume, and number of tumors in DMBA/TPA-induced skin tumorigenesis in mice. [33]

3. This study confirms the immunomodulatory activity of ripe *T. chebula* fruits as evidenced by increase in the concentration of antioxidant enzymes, GSH, T and B cells, the proliferation of which play important roles in immunity. This phenomenon also enhances the concentration of melatonin in the pineal gland as well as the levels of cytokines, such as IL-2, IL-10, and TNF- α , which play essential roles in immunity. [34]
4. In this study the same extract was evaluated for its immunomodulatory activity against *S. typhimurium* in vivo. Animals pretreated with the same extract at a dose 500 mg/kg body wt orally showed an increase in WBC count by $3 \times 10^3/\text{cu mm}$ and lymphocyte count by 4 % as compared to saline treated control challenged with 50000 colony forming unit of *S. typhimurium*. The drug showed the proliferation of lymphocyte by 102% and increase in food pad thickness by 28.87% as compared to infected control in delayed type of hypersensitivity test. Thus the drug showed its protective effect through its immunomodulatory activity in mice and can be used in typhoid. [35]
5. The anti-amoebic effect of a crude drug formulation of *T. chebula* was investigated in experimental caecal amoebiasis in rats with a curative rate of 89% at 500 mg/kg body weight due to varying degrees of inhibition of enzyme activities such as DNase, RNase, aldolase, alkaline phosphatase, acid phosphatase, α amylase and protease in axenically cultured amoebae. [36]
6. It is mainly used as an astringent, laxative, stomachic, and tonic. *Chebula* has been investigated for its effect on cell-mediated and humoral components of the immune system. [37]
7. Crude extract of *T. chebula* stimulated cell-mediated immune response in experimental amoebic liver abscess in golden hamsters. [38]
8. Aqueous extract of *T. chebula* produced an increase in humoral antibody titer and delayed-type hypersensitivity in mice. [39]

Discussion:

Terminalia chebula, commonly known as *Haritaki*, occupies a prominent position in *Ayurvedic* medicine due to its extensive therapeutic properties. This study consolidates evidence from diverse pharmacological investigations to elucidate *Haritaki's* immunomodulatory effects. The herb's role as a *Rasayana*, aimed at promoting longevity and vitality, is underscored by its ability to enhance immunity through various mechanisms.

Haritaki's immunostimulatory action is supported by studies demonstrating its capacity to boost both cellular and humoral immune responses. For instance, research has shown that *Haritaki* extract promotes lymphocyte proliferation and increases the production of key cytokines such as IL-2, IL-10, and TNF- α , crucial for immune function regulation. These effects suggest that *Haritaki* could potentially enhance host defence mechanisms against infections and diseases.

Moreover, *Haritaki* exhibits antioxidant properties, as evidenced by its ability to elevate levels of glutathione (GSH) and antioxidant enzymes. This antioxidative capacity is vital in mitigating oxidative stress, a contributing factor to various chronic ailments and aging processes.

The herb's therapeutic potential extends beyond immunomodulation to encompass other health benefits. Studies highlight *Haritaki's* efficacy in managing conditions such as diabetes and amoebiasis. Its antidiabetic properties, attributed to compounds like chebulic acid, indicate promise in regulating blood glucose levels and preventing diabetic complications. Similarly, *Haritaki's* anti-amoebic activity has been demonstrated in experimental models, suggesting its utility in treating parasitic infections.

The findings from this review underscore the holistic approach of Ayurveda in leveraging natural substances like *Haritaki* to promote health and well-being. However, further clinical studies are warranted to validate these findings and explore *Haritaki's* potential as an adjunct therapy in modern medical practices. Overall, *Haritaki* emerges as a potent immunostimulant with broad therapeutic applications, deserving further investigation for its role in enhancing immune function and overall health promotion.

Limitations& future directions:

- Most evidence comes from in vitro and animal studies, clinical trials evaluating isolated *haritaki* extract are limited.
- Active ingredient and optimal formulations(extracts vs whole fruit vs polyherbal mixtures) need standardization and validation.
- Future studies should compare the effects of *Haritaki* and modern immunomodulators in clinical trials, focusing on long-term immune system health and recovery and across different age groups or disease states.
